Dear ali

Many thanks for an illuminating post on the growing normalization of corporate, educational, and artistic AI-powered writing tools. We made the point (more than once) that the same technology can be incredibly efficient, but at the same time difficult for people (or humanity) to address key human capabilities (originality, critical thinking, etc). In terms of creativity, I was really taken by the implications you made of AI "reducing the complexity of the human mind", in the way that it threatens to reduce the diversity of human emotions as well as the cultural diversity of what we write about (Bozkurt, Aras, et al., 2024).

Speaking of which, one great way of finding the balance between efficiency and originality is to adhere to explicit usage policies. Organisations could, meanwhile, require that an independent human review any email or report produced by AI algorithms to ensure that it does not lead to unaudited decision-making (Tiron-Tudor, and Deliu, 2022). This is not to detract from the preservation of accountability and, with it, productivity gains on the administrative front going in. In the classroom, for instance, educators might ask the students and researchers to report on which AI tools they have worked on, to critique whatever the product of AI is, which would serve to make AI a learning tool rather than a replacement for analysis.

Some authors of creative works are already combining AI-generated drafts with their own "depth edits" to enhance the work's emotional depth, cultural specificity, and distinctive narrative structures. And doing so would allow the fire to be saved without robbing people of their voices (Mazzi, 2024). Finally, it would be beneficial to include regular audits of bias as part of an organization's and/or publication's process, or to look for additional tools that would flag harmful stereotypes prior to publication, given the concern you raise regarding the risk of bias and false claims (Benoit, 2025).

It means equally, as you correctly point out. Describe the advantages and disadvantages of AI. If we forego careful control and disclosure of its workings, AI will not improve human creativity and judgment.

Dear Saleh,

Your post gives a balanced picture of AI “robo-writers” operations across administrative, technical, and creative contexts. I especially liked how you linked the warning about “fluency without understanding” to concrete examples from different studies. This framing makes it easy to see that the same technology that speeds up low-risk administrative work can create serious problems when the content becomes more specialised or original.

Building on your points, one way to minimise those risks is to formalise “human-in-the-loop” practices at each level (Kumar, Sushant, et al. 2024). For instance, in technical or professional writing, AI outputs could be restricted to outlining, summarising, or initial drafts, while domain experts complete the analysis, add references, and verify facts (Enarsson, Enqvist, and Naarttijärvi, 2022). This would protect against fabricated sources or hidden biases and also help maintain staff members’ analytical and rhetorical skills.

In creative work, writers could use AI to generate prompts or stylistic experiments, but treat these outputs as raw material to be transformed through their own editing, emotional depth, and cultural knowledge (Iyengar, 2025). Combining this with explicit disclosure—stating which parts were AI-assisted—would preserve transparency and originality, as you recommend.

Your emphasis on “AI as an aid, not a replacement” captures the key lesson of the current research: the benefits of generative models are real but conditional. With careful supervision, fact-checking, and disclosure, organisations and writers can harness AI’s productivity gains without eroding the human insight and creativity that give writing its value.
