Your post offers a well-structured and insightful analysis of the layered implications of AI writers across different domains. I particularly appreciated your emphasis on the deceptive fluency of AI-generated text, as Hutson (2021) rightly warns that eloquence can mask a lack of genuine understanding. Your breakdown of administrative, professional, and creative writing contexts is thoughtful and supported by relevant literature.

The point about AI enhancing productivity in administrative tasks is compelling—especially when paired with the low-risk nature of such outputs. However, your caution about overreliance in technical writing resonates deeply. As Li et al. (2024) suggest, while AI can boost confidence, it may also flatten stylistic diversity and reduce critical engagement, which are essential in academic and professional discourse.

Your critique of AI in creative writing is especially powerful. The risk of homogenization and cultural bias, as Glynn (2024) notes, is a real concern. I also agree with your endorsement of Hutson's (2025) call for a collaborative model—where AI serves as a tool, not a replacement. Transparency, ethical oversight, and human authorship must remain central.

Overall, your post balances optimism with caution, and your use of sources strengthens your argument. It's a thoughtful contribution to a complex and evolving conversation.

I agree with you in the growing usage of AI in writing namely its threats and its benefits in the various domains. Admittedly, AI can perform parts of administrative tasks like writing emails and drafting meeting notes and, therefore, can serve as the means of providing additional time to more complex tasks. This will help in enhancement of efficiency with lean loss as far as quality is concerned. Still, I am also in agreement with the problem of unreal knowledge about AI. The AI can generate a text that is fluent by nature, but the human cognition is not so profound, and it results in the generation of a text not only featuring the meaning on its own but also being original (Glynn, 2024). The application of AI in professional or technical writing, as you pointed out, is certain to rise in productivity and even assist in creating and organizing the papers. This could, however, bring about the over-trust of AI lowering the degree of critical thinking and imaginativeness. The articulation of the idea of AI running efficiency written work is valid and it is prudent that it is not replacing the valuable amount of human effort especially in the more complicated work. The other authentic type of concern is the loss of writing variety to the one that is being produced by AI technology and therefore lead to a homogenization of writing (Parycek, Schmid, and Novak, 2024). In the case of creative writing, any inspiration process, as well as even the generation of preliminary assemblers, can occur thanks to AI, provided it is relevant that the human writers can control the vehicle in the creation of a final product. AI has some potential to reproduce biases or to be unable to reach the complexity of human emotion and originality. Herein lies the significance of human input in the artistic process (Li, Liang, Peng, & Yin, 2024). Conclusively, AI can be a useful guiding tool but humanity takes its intelligent and creative and critical involvement in giving the final product its natural and richness.

Hutson (2021) points out that AI writers of the present day can produce fluent and human-like text, but their fluent writing can conceal that they showed no real understanding. This is the tension that is at the heart of the consideration of the advantages and disadvantages of AI writers at various levels of application.

On the administrative side, AI will be able to automate the routine process of writing emails, memos, and meeting notes (Parycek, Schmid, and Novak, 2024). The efficiency enables the human personnel to work on high-level work. The risks are not so high in this case, because the outputs can be easily checked and corrected.

In the case of professional or technical writing, AI solutions may be useful in speeding up the text-writing process, organizing a report, or improving the language. Research indicates that large language models (LLMs) have the ability to enhance productivity and confidence in writing as well as confidence in drafting, yet have the potential to decrease writing style diversity and decrease critical interaction with ideas (Li, Liang, Peng, and Yin, 2024). The risk is that the professionals are going to be over-reliant on AI, and the skills will be gradually lost.

AI can write creative tales, poetry, and dialogue, and provide a new source of inspiration in creative writing. Nonetheless, its derivative character is prone to homogenisation of style and inadvertent plagiarism as well as to the continuance of cultural prejudice existing in its teaching information (Glynn, 2024). In addition, overdependence will reduce originality and undermine the human voice in literature.

To address these risks, Hutson (2025) has suggested a more humane effort to integrate AI into their writing, as it serves as a drafting or brainstorming tool, but the final task is still left to human writers. Intelligence and accountability require the AI use to be disclosed openly, the fact-checking process to be strong, and the bias to be audited critically.

Altogether, AI writers may provide efficiency and help people to create, but Hutson (2021) makes it clear that fluency does not equal wisdom, and real authorship must be a human task.

You have given an excellent and organized summary of Hutson's (2021) arguments and of various ways AI writing tools have an impact on specific domains. In particular, I was delighted by the inclusion of the point of view of different scholars who place the debate in the context of current empirical work. One thing that I find interesting about your post is that it shows a fairly unequal distribution of risk: low risk for routine work but much higher for professional and creative writing.

I think it would be great to see more of the practical stuff organisations or writers can do to avoid the specific problems you find. For instance, in administrative settings, a basic checklist or approval process in place can guarantee that AI-generated emails or reports are inspected before publication (Alnaimat, Fatima, et al. 2025). In academic writing, AI can be used for outlining, summarizing, and drafting parts of the text, and in this way, it becomes easy for students to write their assignments (Wang, Changzhao, et al. 2024).

In creative writing, bias auditing could be incorporated into the writing workflow - authors could intentionally include counter-narratives or run their text through bias-detection tools after using AI (Nabilla, Apriani, and Gusmuliana, 2024). Journals and publishers are also experimenting with "AI contribution" statements, which put disclosure from "elective" to "essential" and reduce the stigma associated with having to do it, as well as enabling the reader to assess their work's credibility.

Overall, your post makes a thorough argument for Hutson's admonition that "fluency does not equal wisdom." This requires building on your analysis, the design of specific protocols, and training for humans to be the primary authors and ethical gatekeepers of AI tools, while also enjoying the productivity gains of AI tools.

I concur with such attitude towards the use of AI in writing particularly the drawbacks and benefits it presents on other arenas. Indeed, automation will enable the AI to streamline the routine of the administration involved in writing emails and creating meeting notes, so it could spend more valuable time to work on more complex tasks. This shall help in efficiency growth without significant drop in quality. However, also the ignorance of AI, I also understand. Although AI is capable of producing text that sounds natural, it lacks the level of understanding that can come with humans, thus questions whether it will produce text with no real meaning of its own or one that would be considered original. Indeed, this is why the use of AI in technical or professional writing can also be productive, as you outlined, and it helps in drafting and structuring documents. However, it also is susceptible to over use of AI which reduces critical thought and imagination. It is legit that AI will save as much time and effort as possible on writing, however, it is essential that it never serves as a substitute of the human effort, at least in rapidly more complicated tasks. Another valid factor that helps form the concern is the fact that the diversity of writing style can also be lost by the AI-generated content that will result in the homogenization of writing. AI could prove helpful in mod creative writing to provide a context, or even write a draft version but it is important to have the human author retain the control in the procession of the finished work. In comparison to the two, AI as you have characterized it, may propagate prejudices unwittingly or the AI may not be capable of portraying the complexity of the human heart and creative potential. This reminds the importance of having human touch in the creative business. And, lastly, however helpful AI may be, it is people with their intelligence, imagination capabilities and critical participation that go into assembling the authorship process as a whole since the end product must be something unique and multi-dimensional.
