

Summary Post

by [Abdulla Husain Salem Hadna Almessabi](#) - Saturday, 11 October 2025, 9:27 AM

The discussion around AI writers highlights both their remarkable potential and their inherent limitations. As Zheng, (2024) explains, AI-generated text often appears fluent and coherent, yet this fluency can disguise a lack of true understanding. This distinction lies at the centre of evaluating the advantages and disadvantages of AI in different writing contexts.

In administrative settings, AI can effectively automate repetitive tasks such as emails, memos, and reports (Singh, 2024). These functions enhance efficiency and free human workers to focus on complex, strategic decisions. Since such outputs are easily reviewed, the ethical and quality risks remain low. However, the situation becomes more complex in professional and technical writing. While AI tools can enhance productivity, assist in drafting, and improve language accuracy, they may also reduce stylistic diversity and critical engagement, potentially diminishing human creativity and analytical thinking (Khalifa, & Albadawy, 2024).

In creative fields, AI offers inspiration through idea generation, storytelling, and stylistic experimentation. Yet its outputs remain derivative, often reinforcing cultural biases and limiting originality (Begum, 2025). Overreliance may undermine authenticity and the distinct human voice that defines literature and art. According to Al-Zahrani, (2024) the most balanced approach is to adopt AI as a collaborative tool for brainstorming and drafting while ensuring that the final responsibility for judgment, accuracy, and creativity remains human. Ethical writing practices require transparency in AI use, rigorous fact-checking, and ongoing bias auditing.

Ultimately, AI's fluency should not be mistaken for intelligence. When used thoughtfully, these tools can enhance productivity and creativity, but genuine authorship, critical reflection, and accountability must remain distinctly human. There is always a difference between the intelligence the AI generated outputs because there is always a mind behind the training of the machines that creates the outputs based on the queries. So the intelligence generated by the human mind can never be comparable with the outputs generated by the machines (trained by the human minds). So in my opinion, machines can never surpass the uniqueness of the human mind.
