

Summary Post

by [Abdulla Husain Salem Hadna Almessabi](#) - Saturday, 11 October 2025, 9:30 AM

The discussion in these weeks was very elaborative and I learnt a lot during the sessions. The major takeaways from this discussion for me was understanding the concept that deep learning models have changed the creativity, education and productivity significantly but these also come with a lot of challenges and issues. According to Chen, Ziyu, et al. (2024), the major issue related to the use of AI models in academics is integrity. These models can be used to generate false images or texts to deceive the people (Oladoyinbo, Tunboson Oyewale, et al. 2024). Moreover, in the learning process, these models are limiting the human creativity by generating academic texts for students (Mijwil, Maad M., et al. 2023). Chatgpt is one of the examples in this regard. After this discussion I also applied in my daily life and I found that my creativity and thinking process was challenged when I was using chatgpt to get answers to my questions. This was an experiment that I applied to myself after this discussion and I found it correct that these models limit my creativity and thought process. Moreover, there are also copyright issues related to the image generating AI models. The main theme for the AI models is inspired by the data provided to them during training and as a result the output given by these models raises questions related to intellectual property (Kimera, Kim, & Choi, 2024). The solution to these problems for copyrights can be resolved by watermarking of all the images and texts generated by AI (Limongi, 2024). Moreover, this is a dire need to help the users of AI models to understand the utility and focus on the help provided by these models rather than depending solely on their work. In this way, I think we will be able to keep on growing in terms of critical thinking. To conclude, I would say that the usage of the AI models in any domain of life is not bad but the way we use it does matter. We need to be ethical and morally correct to apply usage of AI in our lives.
