Ethical Issues in Deep Learning Content Generation

The advent of Deep Learning models like the DALL-E engine of OpenAI and ChatGPT has shown that intelligent systems do not necessarily end with the creation of new content, whether in the form of a realistic image or a full-fledged prose (Derevyanko and Zalevska, 2023). Although these technologies have transformed creativity, education, and productivity, they also present considerable ethical issues that need to be considered.

One of the main issues is the information misrepresentation and integrity. Deep Learning systems can generate very realistic text or images that can be used to falsify news, impersonate people, or control the masses (Floridi and Chiriatti, 2020). According to Doyle and Senske (2018), in the absence of the provenance or the watermarking of the information, it becomes hard to distinguish between the material generated by humans and the material generated by machines.

One more ethical concern is associated with discrimination and equality. Deep Learning models are trained using large amounts of data that can be biased towards society. Therefore, the outputs can reinforce the stereotypes without meaning it or reflect the minority views (Bender et al., 2021). This may prove detrimental in sensitive situations such as in recruitment, education, or criminal justice.

Also, it has intellectual property and consent issues. Image generators such as DALL-E can create a visual similar to a work under copyright or adopt the styles of artists without their consent, and the issue of ownership and payment can be raised (Murray, 2023).

To address these issues, developers and policymakers ought to incorporate transparency (e.g., content labelling), have solid data governance, and define clear ethical guidelines of deployment and use. Such protections would assist society in enjoying the positive aspects of Deep Learning and reduce its potential harms.
