

Action plan

This diagnosis was directly informed by a tangible Action Plan. In order to resolve my weaknesses in the literature review, I decided to use reference management software (Zotero) and a systematic template for extracting papers. In terms of statistical skills, I planned my practice time with Python, the Scipy and StatsModels libraries and the worksheets of the module. Moreover, I also realised that I needed to work on project management discipline, which prompted me to use Gantt charts and risk registers in my proposal. This process of evaluation and planning in a cyclical manner converted abstract learning objectives into tasks that could be done at specific times, which is an important professional skill of self-directed development.
