

Hi,

This is a solid and well-structured proposal that demonstrates a strong understanding and application of knowledge. You justify most design decisions with relevant evidence and provide clear, professional outputs. Your design is coherent and grounded in good references, but it needs fixes in several critical technical points (transfer protocol, write-blocker emulation, cryptography/key management, and parallelism claims). Also, tighten up benchmarking claims and legal/regulatory wording to avoid overstating compliance or performance. Please find the detailed feedback below:

Knowledge & Understanding

- Clear understanding of the domain with relevant discussion of requirements.
- Academic references appropriately support design choices.

Application of Knowledge

- Concepts applied effectively in system design.
- Challenges identified with reasonable strategies.
- Good application of paradigms and design practices.

Criticality

- Design choices are justified with evidence.
- Strengths and weaknesses are discussed in a balanced way.
- Some evaluation of alternatives is included.

Structure & Presentation

- The report is clear, logically structured, and professional.
- Graphical models are appropriate and enhance explanation.

However, there are a few points that you should consider:

1. There is confusion about SFTP vs TLS 1.3

2. Opening files with `os.O_RDONLY` *by itself* does not guarantee forensically clean handling. The OS may still update metadata (access times), and some drivers/filesystems allow writes by other means.

3. SHA-256 test vector claimed incompletely and without context.
